File I

\zref-check implementation

Start the DocStrip guards.

```

1 <*package>
    Identify the internal prefix (LATEX3 DocStrip convention).
2 <@@=zrefcheck>

```

1 Initial setup

For the `chapter` and `section` checks, `zref-check` uses the new hook system in `ltxcmds`, which was released with the 2021/06/01 L^AT_EX kernel.

```

3 \providecommand\IfFormatAtLeastTF{\@ifl@t@r\fmtversion}
4 \IfFormatAtLeastTF{2021-06-01}
5 {}
6 {%
7   \PackageError{zref-check}{LaTeX kernel too old}
8   {%
9     'zref-check' requires a LaTeX kernel newer than 2021-06-01.%
10    \MessageBreak Loading will abort!%
11   }%
12   \endinput
13 }%

14 \ProvidesExplPackage {zref-check} {2021-07-27} {0.1.0-alpha}
15 {Flexible cross-references with contextual checks based on zref}

```

2 Dependencies

```

16 \RequirePackage { zref-user }
17 \RequirePackage { zref-abspage }
18 \RequirePackage { ifdraft }

```

3 zref setup

`\g__zrefcheck_abschap_int` Provide absolute counters for section and chapter, and respective `zref` properties, so that we can make checks about relation of chapters/sections regardless of internal counters, since we don't get those for the unnumbered (starred) ones. About the proper place to make the hooks for this purpose, see <https://tex.stackexchange.com/q/605533/105447>, thanks Ulrike Fischer.

```

19 \int_new:N \g__zrefcheck_abschap_int
20 \int_new:N \g__zrefcheck_abssec_int

```

(End definition for `\g__zrefcheck_abschap_int` and `\g__zrefcheck_abssec_int`.)

If the documentclass does not define `\chapter` the only thing that happens is that the chapter counter is never incremented, and the section one never reset.

```

21 \AddToHook { cmd / chapter / before }
22 {
23   \int_gincr:N \g__zrefcheck_abschap_int
24   \int_zero:N \g__zrefcheck_abssec_int
25 }
26 \zref@newprop { abschap } [0] { \int_use:N \g__zrefcheck_abschap_int }
27 \zref@addprop \ZREF@mainlist { abschap }
28 \AddToHook { cmd / section / before }
29 { \int_gincr:N \g__zrefcheck_abssec_int }
30 \zref@newprop { abssec } [0] { \int_use:N \g__zrefcheck_abssec_int }
31 \zref@addprop \ZREF@mainlist { abssec }

```

This is the list of properties to be used by zref-check, that is, the list of properties the references and targets store. This is the minimum set required, more properties may be added according to options.

```

32 \zref@newlist { zrefcheck }
33 \zref@addprops { zrefcheck }
34 {
35   abspage ,
36   abschap ,
37   abssec ,
38   page
39 }

```

4 Plumbing

144     {
145         \ifdraft
146         { \tl_set:Nn \l__zrefcheck_msglevel_tl { info } }
147         { \tl_set:Nn \l__zrefcheck_msglevel_tl { warning } }
148     } ,
149     msglevel / obeyfinal .code:n =
150     {

```

```

151         \ifoptionfinal
152         { \tl_set:Nn \l__zrefcheck_msglevel_tl { warning } }
153         { \tl_set:Nn \l__zrefcheck_msglevel_tl { info } }
154     } ,
155     msglevel .value_required:n = true ,
156     msglevel .initial:n = warn ,

```

`ignore` is a convenience alias for `msglevel=none`, but only for use in the document body.

```

157     ignore .code:n =
158     { \msg_warning:nn { zref-check } { ignore-document-only } }
159 }

```

(End definition for `\l__zrefcheck_msglevel_tl`.)

```

160 \AtBeginDocument
161 {
162     \keys_define:nn { zref-check }
163     { ignore .meta:n = { msglevel = none } }
164 }

```

`onpage` option

`\l__zrefcheck_msgonpage_bool`

```

165 \bool_new:N \l__zrefcheck_msgonpage_bool
166 \keys_define:nn { zref-check }
167 {
168     onpage .choice: ,
169     onpage / labelseq .code:n =
170     {
171         \bool_set_false:N \l__zrefcheck_msgonpage_bool
172     } ,
173     onpage / msg .code:n =
174     {
175         \bool_set_true:N \l__zrefcheck_msgonpage_bool
176     } ,
177     onpage / obeydraft .code:n =
178     {
179         \ifdraft
180         { \bool_set_false:N \l__zrefcheck_msgonpage_bool }
181         { \bool_set_true:N \l__zrefcheck_msgonpage_bool }
182     } ,
183     onpage / obeyfinal .code:n =
184     {
185         \ifoptionfinal
186         { \bool_set_true:N \l__zrefcheck_msgonpage_bool }
187         { \bool_set_false:N \l__zrefcheck_msgonpage_bool }
188     } ,
189     onpage .value_required:n = true ,
190     onpage .initial:n = labelseq
191 }

```

(End definition for `\l__zrefcheck_msgonpage_bool`.)

`closerange` option

\l_zrefcheck_close_range_int

```

192 \int_new:N \l__zrefcheck_close_range_int
193 \keys_define:nn { zref-check }
194 {
195   closerange .int_set:N = \l__zrefcheck_close_range_int ,
196   closerange .value_required:n = true ,
197   closerange .initial:n = 5
198 }

```

(End definition for \l__zrefcheck_close_range_int.)

labelcmd option

\l_zrefcheck_target_label_tl

```

199 \tl_new:N \l__zrefcheck_target_label_tl
200 \bool_new:N \l__zrefcheck_target_label_bool
201 \keys_define:nn { zref-check }
202 {
203   labelcmd .code:n =
204   {
205     \tl_set:NV \l__zrefcheck_target_label_tl \l_keys_value_tl
206     \bool_set_true:N \l__zrefcheck_target_label_bool
207   } ,
208   labelcmd .value_required:n = true ,
209 }

```

(End definition for \l__zrefcheck_target_label_tl.)

__zrefcheck_target_label:n

Default definition of the function for user label setting in \zrctarget and zrcregion. It may be redefined at begindocument according to option labelcmd.

```

210 \cs_new:Npn \__zrefcheck_target_label:n #1
211 { \zref@labelbylist {#1} { zrefcheck } }

```

(End definition for __zrefcheck_target_label:n.)

```

212 \AtBeginDocument
213 {
214   \bool_if:NT \l__zrefcheck_target_label_bool
215   {
216     \cs_if_exist:cTF { \l__zrefcheck_target_label_tl }
217     {
218       \cs_set:Npx \__zrefcheck_target_label:n #1
219       {
220         \exp_not:o
221         { \cs:w \l__zrefcheck_target_label_tl \cs_end: }
222         {#1}
223       }
224     }
225     {
226       \exp_args:NnnV \msg_warning:nnn { zref-check }
227       { labelcmd-undefined } { \l__zrefcheck_target_label_tl }
228     }
229   }
230   \keys_define:nn { zref-check }
231   {
232     labelcmd .code:n =

```

```

233     {
234         \msg_warning:nnn { zref-check }
235         { option-preamble-only } { labelcmd }
236     }
237 }
238 }

```

Process load-time package options (<https://tex.stackexchange.com/a/15840>).

```

239 \RequirePackage { l3keys2e }
240 \ProcessKeysOptions { zref-check }

```

`\zrchecksetup` Provide `\zrchecksetup`.

```

241 \NewDocumentCommand \zrchecksetup { m }
242 { \keys_set:nn { zref-check } {#1} }

```

(End definition for `\zrchecksetup`. This function is documented on page ??.)

4.3 Position on page

Method for determining relative position within the page: the sequence in which the labels get shipped out, inferred from the sequence in which the labels occur in the `.aux` file.

Some relevant info about the sequence of things: <https://tex.stackexchange.com/a/120978> and `texdoc lthooks`, section “Hooks provided by `\begin{document}`”.

One first attempt at this was to use `\zref@newlabel`, which is the macro in which `zref` stores the label information in the aux file. When the `.aux` file is read at the beginning of the compilation, this macro is expanded for each of the labels. So, by redefining this macro we can feed a variable (a L3 sequence), and then do what it usually does, which is to define each label with the internal macro `\@newl@bel`, when the `.aux` file is read.

Patching this macro for this is not possible. First, `\zref@newlabel` is one of those “commands that look ahead” mentioned in `ltxcmdhooks` documentation. Indeed, `\@newl@bel` receives 3 arguments, and `\zref@newlabel` just passes the first, the following two will be scanned ahead. Second, the `ltxcmdhooks` hooks are not actually available when the `.aux` file is read, they come only after `\begin{document}`. Hence, redefinition would be the only alternative. My attempts at this ended up registered at <https://tex.stackexchange.com/a/604744>. But the best result in these lines was:

```

\ZREF@Robust\edef\zref@newlabel#1{
  \noexpand\seq_gput_right:Nn \noexpand\g__zrefcheck_auxfile_lblseq_seq {#1}
  \noexpand\@newl@bel{\ZREF@RefPrefix}{#1}
}

```

However, better than the above is to just read it from the `.aux` file directly, which relieves us from hacking into any internals. That’s what David Carlisle’s answer at <https://tex.stackexchange.com/a/147705> does. This answer has actually been converted into the package `listbls` by Norbert Melzer, but it is made to work with regular labels, not with `zref`’s. And it also does not really expose the information in a retrievable way (as far as I can tell). So, the below is adapted from Carlisle’s answer’s technique (a poor man’s version of it...).

There is some subtlety here as to whether this approach makes it safe for us to read the labels at this point without `\zref@wrapper@babel`. The common wisdom is that `babel`’s shorthands are only active after `\begin{document}` (e.g., <https://tex.stackexchange.com/a/147705>).

[//tex.stackexchange.com/a/98897](https://tex.stackexchange.com/a/98897)). Alas, it is more complicated than that. Babel’s documentation says (in section 9.5 Shorthands): “To prevent problems with the loading of other packages after babel we reset the catcode of the character to the original one at the end of the package and of each language file (except with KeepShorthandsActive). It is re-activate[d] again at `\begin{document}`. We also need to make sure that the shorthands are active during the processing of the `.aux` file. Otherwise some citations may give unexpected results in the printout when a shorthand was used in the optional argument of `\bibitem` for example.” This is done with `\if@files\write\@mainaux{...}`. In other words, the catcode change is written in the `.aux` file itself! Indeed, if you inspect the file, you’ll find them there. Besides, there is still the ominous “except with KeepShorthandsActive”.

However, the *method* we’re using here is not quite the same as the usual run of the `.aux` file, because we’re actively discarding the lines for which the first token is not equal to `\zref@newlabel`. I have tested the famous sensitive case for this: `babel french` and labels with colons. And things worked as expected. Well, *if* KeepShorthandsActive is enabled *with french* and we load the package *after babel* things do break, but not quite because of the colons in the labels. Even siunitx breaks in the same conditions...

For reference: About what are valid characters for use in labels: <https://tex.stackexchange.com/a/18312>. About some problems with active colons: <https://tex.stackexchange.com/a/89470>. About the difference between L3 strings and token lists, see <https://tex.stackexchange.com/a/446381>, in particular Joseph Wright’s comment: “Strings are for data that will never be typeset, for example file names, identifiers, etc.: if the material may be used in typesetting, it should be a token list.” See also moewe’s (CW) answer in the same lines. Which suggests using L3 strings for the reference labels might be a good catch all approach, and possibly more robust. David Carlisle’s comment about inputenc is a caveat (see https://tex.stackexchange.com/q/446123#comment1516961_446381). Still... let’s stick to tradition as long as it works, `\zref` already does a great job here anyway.

`\g_zrefcheck_auxfile_lblseq_prop`

```
243 \prop_new:N \g_zrefcheck_auxfile_lblseq_prop
```

(End definition for `\g_zrefcheck_auxfile_lblseq_prop`.)

```
244 \tl_set:Nn \g_tmpa_tl { \c_sys_jobname_str .aux }
```

```
245 \file_if_exist:nT { \g_tmpa_tl }
```

```
246 {
```

Retrieve the information from the `.aux` file, and store it in a property list, so that the sequence can be retrieved in key-value fashion.

```
247 \ior_open:Nn \g_tmpa_ior { \g_tmpa_tl }
```

```
248 \group_begin:
```

```
249 \int_zero:N \l_tmpa_int
```

```
250 \tl_clear:N \l_tmpa_tl
```

```
251 \tl_clear:N \l_tmpb_tl
```

```
252 \bool_set_false:N \l_tmpa_bool
```

```
253 \ior_map_variable:NNn \g_tmpa_ior \l_tmpa_tl
```

```
254 {
```

```
255 \tl_map_variable:NNn \l_tmpa_tl \l_tmpb_tl
```

```
256 {
```

```
257 \tl_if_eq:NnTF \l_tmpb_tl { \zref@newlabel }
```

```
258 {
```

Found a `\zref@label`, signal it.

```

259         \bool_set_true:N \l_tmpa_bool
260     }
261     {
262         \bool_if:NTF \l_tmpa_bool
263         {
264             \bool_set_false:N \l_tmpa_bool
265             \int_incr:N \l_tmpa_int
266             \prop_gput:Nxx \g__zrefcheck_auxfile_lblseq_prop
267                 { \l_tmpb_tl } { \int_use:N \l_tmpa_int }
268         }
269     }

```

If there is not a match of the first token with `\zref@newlabel`, break the loop and discard the rest of the line, to ensure no babel calls to `\catcode` in the `.aux` file get expanded. This also breaks the loop and discards the rest of the `\zref@newlabel` lines after we got the label we wanted, since we reset `\l_tmpa_bool` in the T branch.

```

270         \tl_map_break:
271     }
272 }
273 }
274 }
275 \group_end:
276 \ior_close:N \g_tmpa_ior
277 }

```

The alternate method I had considered (more than that...) for this was using `yx` coordinates supplied by `zref`’s `savepos` module. However, this approach brought in a number of complexities, including the need to patch either `\zref@label` or `\ZREF@label`. In addition, the technique was at the bottom fundamentally flawed. Ulrike Fischer was very much right when she said that “structure and position are two different beasts” (<https://github.com/ho-tex/zref/issues/12#issuecomment-880022576>). It is true that the checks based on it behaved decently, in normal circumstances, and except for outrageous label placement by the user, it would return the expected results. We don’t really need exact coordinates to decide “above/below”. Besides, it would do an exact job for the dedicated target macros of this package. However, I could not conceive a situation where the `yx` criterion would perform clearly better than the `labelseq` one. And, if that’s the case, and considering the complications it brings, this check was a slippery slope. All in all, I’ve decided to drop it.

4.4 Counter

We need a dedicated counter for the labels generated by the checks and targets. The value of the counter is not relevant, we just need it to be able to set proper anchors with `\refstepcounter`. And, since I couldn’t find a `\refstepcounter` equivalent in L3, we use a standard 2e counter here. I’m also using the technique to ensure the counter is never reset that is used by `zref-abspage.sty` and `\zref@require@unique`. I don’t know why it is needed, but if Oberdiek does it, there must be a reason. In any case, the requirements are the same, we need numbers ensured to be *unique* in the counter.

```

278 \begingroup
279 \let \@addtoreset \ltx@gobbletwo
280 \newcounter { zrefcheck }

```

```

281 \endgroup
282 \setcounter { zrefcheck } { 0 }

```

4.5 Label formats

```

\__zrefcheck_check_lblfmt:n      \__zrefcheck_check_lblfmt:n {\check id int}
283 \cs_new:Npn \__zrefcheck_check_lblfmt:n #1 { zrefcheck@ \int_use:N #1 }
(End definition for \__zrefcheck_check_lblfmt:n.)

```

```

\__zrefcheck_end_lblfmt:n      \__zrefcheck_end_lblfmt:n {\label}
284 \cs_new:Npn \__zrefcheck_end_lblfmt:n #1 { #1 @zrefcheck }
(End definition for \__zrefcheck_end_lblfmt:n.)

```

4.6 Property values

`\zrefcheck_get_astl:nnn` A convenience function to retrieve property values from labels. Uses `\g__zrefcheck_auxfile_lblseq_prop` for `lblseq`, and calls `\zref@extractdefault` for everything else.

We cannot use the “return value” of `__zrefcheck_get_astl:nnn` or `__zrefcheck_get_asint:nnn` directly, because we need to use the retrieved property values as arguments in the checks, however we use here a number of non-expandable operations. Hence, we receive a local `tl/int` variable as third argument and set that, so that it is available (and expandable) at the place of use. For this reason, we do not group here, because we are passing a local variable around, but it is expected this function will be called within a group.

We’re returning `\c_empty_tl` in case of failure to find the intended property value (explicitly in `\zref@extractdefault`, but that is also what `\tl_clear:N` does).

```

\zrefcheck_get_astl:nnn {\label} {\prop} {\tl var}

285 \cs_new:Npn \zrefcheck_get_astl:nnn #1#2#3
286 {
287   \tl_clear:N #3
288   \tl_if_eq:nnTF {#2} { lblseq }
289   {
290     \prop_get:NnNF \g__zrefcheck_auxfile_lblseq_prop {#1} #3
291     {
292       \msg_warning:nnnn { zref-check }
293       { property-not-in-label } {#1} {#2}
294     }
295   }
296   {

```

There are three things we need to check to ensure the information we are trying to retrieve here exists: the existence of `{\label}`, the existence of `{\prop}`, and whether the particular label being queried actually contains the property. If that’s all in place, the value is passed to the checks, and it’s their responsibility to verify the consistency of this value.

The existence of the label is an user facing issue, and a warning for this is placed in `__zrefcheck_zrcheck:nnnnn` (and done with `\zref@refused`). We do check here

though for definition with `\zref@ifrefundefined` and silently do nothing if it is undefined, to reduce irrelevant warnings in a fresh compilation round. The other two are more “internal” problems, either some problem with the checks, or with the configuration of `zref` for their consumption.

```

297     \zref@ifrefundefined {#1}
298     {}
299     {
300         \zref@ifpropundefined {#2}
301         { \msg_warning:nnnn { zref-check } { property-undefined } {#2} }
302         {
303             \zref@ifrefcontainsprop {#1} {#2}
304             {
305                 \tl_set:Nx #3
306                 { \zref@extractdefault {#1} {#2} { \c_empty_tl } }
307             }
308             {
309                 \msg_warning:nnnn
310                 { zref-check } { property-not-in-label } {#1} {#2}
311             }
312         }
313     }
314 }
315 }

```

(End definition for `\zrefcheck_get_astl:nnn`.)

`\l__zrefcheck_integer_bool` `\zrefcheck_get_asint:nnn` is a very convenient wrapper around the more general `\zrefcheck_get_astl:nnn`, since almost always we’ll be wanting to compare numbers in the checks. However, it is quite hard for it to ensure an integer is *always* returned in the case of errors. And those do occur, even in a well structured document (e.g., in a first round of compilation). To complicate things, the L3 integer predicates are *very* sensitive to receiving any other kind of data, and they *scream*. To handle this `\zrefcheck_get_asint:nnn` uses `\l__zrefcheck_integer_bool` to signal if an integer could not be returned. To use this function always set `\l__zrefcheck_integer_bool` to true first, then call it as much as you need. If any of these calls got is returning anything which is not an integer, `\l__zrefcheck_integer_bool` will have been set to false, and you should check that this hasn’t happened before actually comparing the integers (`\bool_lazy_and:nnTF` is your friend).

```

316 \bool_new:N \l__zrefcheck_integer_bool

```

(End definition for `\l__zrefcheck_integer_bool`.)

`\l__zrefcheck_propval_tl`

```

317 \tl_new:N \l__zrefcheck_propval_tl

```

(End definition for `\l__zrefcheck_propval_tl`.)

`\zrefcheck_get_asint:nnn` `\zrefcheck_get_asint:nnn` `{<label>}` `{<prop>}` `{<int var>}`

```

318 \cs_new:Npn \zrefcheck_get_asint:nnn #1#2#3
319 {
320     \zrefcheck_get_astl:nnn {#1} {#2} { \l__zrefcheck_propval_tl }
321     \__zrefcheck_is_integer:nTF { \l__zrefcheck_propval_tl }
322     {

```

Make it an integer data type.

```

323     \int_set:Nn #3 { \int_eval:n { \l__zrefcheck_propval_tl } }
324   }
325   {
326     \bool_set_false:N \l__zrefcheck_integer_bool
327     \zref@ifrefundefined {#1}

```

Keep silent if ref is undefined to reduce irrelevant warnings in a fresh compilation round. Again, this is also not the point to check for undefined references, that’s a task for `__zrefcheck_zrcheck:nnnnn`.

```

328     { }
329     {
330       \msg_warning:nnnn { zref-check }
331       { property-not-integer } {#2} {#1}
332     }
333   }
334 }

```

(End definition for `\zrefcheck_get_asint:nnn`.)

```

\__zrefcheck_is_integer:n
\__zrefcheck_int_to_roman:w

```

Thanks egreg: <https://tex.stackexchange.com/a/244405>, also see <https://tex.stackexchange.com/a/19769>. Following the `l3styleguide`, I made a copy of `__int_to_roman:w`, since it is an internal function from the `int` module, but we still get a warning from `l3build doc`, complaining about it. And I’m using `\tl_if_empty:oTF` instead of `\tl_if_blank:oTF` as in egreg’s answer, since `\romannumeral` is defined so that “the expansion is empty if the number is zero or negative”, not “blank”. A couple of comments about this technique: the underlying `\romannumeral` ignores space tokens and explicit signs (+ and -) in the expansion and hence it can only be used to test positive integers; also the technique cannot distinguish whether it received an empty argument or if “the expansion was empty” as a result of receiving a zero or negative number as argument, so this must also be controlled for since, in our use case, this may happen.

```

335 \cs_new_eq:NN \__zrefcheck_int_to_roman:w \__int_to_roman:w
336 \prg_new_conditional:Npnn \__zrefcheck_is_integer:n #1 { p, T , F , TF }
337   {
338     \tl_if_empty:oTF {#1}
339     { \prg_return_false: }
340     {
341       \tl_if_empty:oTF { \__zrefcheck_int_to_roman:w -0#1 }
342       { \prg_return_true: }
343       { \prg_return_false: }
344     }
345   }

```

(End definition for `__zrefcheck_is_integer:n` and `__zrefcheck_int_to_roman:w`.)

```

\__zrefcheck_is_integer_rgx:n

```

A possible alternative to `__zrefcheck_is_integer:n` is to use a straightforward regexp match (see <https://tex.stackexchange.com/a/427559>). It does not suffer from the mentioned caveats from the `\tex_romannumeral:D` technique, however, while `__zrefcheck_is_integer:n` is expandable, `__zrefcheck_is_integer_rgx:n` is not. Also, `__zrefcheck_is_integer_rgx:n` is probably slower.

```

346 \prg_new_protected_conditional:Npnn \__zrefcheck_is_integer_rgx:n #1 { TF }
347   {
348     \regex_match:nnTF { \A\d+\Z } {#1}

```

```

349     { \prg_return_true: }
350     { \prg_return_false: }
351   }
352 \prg_generate_conditional_variant:Nnn \__zrefcheck_is_integer_rgx:n { x } { TF }
(End definition for \__zrefcheck_is_integer_rgx:n.)

```

5 User interface

5.1 \zrcheck

`\zrcheck` The $\langle\textit{text}\rangle$ argument of `\zrcheck` should not be long, since `\hyperlink` cannot receive a long argument. Besides, there is no reason for it to be. Note, also, that hyperlinks crossing page boundaries have some known issues: <https://tex.stackexchange.com/a/182769>, <https://tex.stackexchange.com/a/54607>, <https://tex.stackexchange.com/a/179907>.

`\zrcheck{*}[\langle\textit{options}\rangle]{\langle\textit{labels}\rangle}[\langle\textit{checks}\rangle]{\langle\textit{text}\rangle}`

```

353 \NewDocumentCommand \zrcheck
354 { s O { } } > { \SplitList { , } } m > { \SplitList { , } } 0 { } m }
355 { \zref@wrapper@babel \__zrefcheck_zrcheck:nnnnn {#3} {#1} {#2} {#4} {#5} }

```

(End definition for `\zrcheck`. This function is documented on page ??.)

```

\g__zrefcheck_id_int
\l__zrefcheck_checkbeg_tl 356 \int_new:N \g__zrefcheck_id_int
\l__zrefcheck_checkend_tl 357 \tl_new:N \l__zrefcheck_checkbeg_tl
\l__zrefcheck_link_label_tl 358 \tl_new:N \l__zrefcheck_checkend_tl
\l__zrefcheck_link_anchor_tl 359 \tl_new:N \l__zrefcheck_link_label_tl
\l__zrefcheck_link_star_tl 360 \tl_new:N \l__zrefcheck_link_anchor_tl
361 \bool_new:N \l__zrefcheck_link_star_tl

```

(End definition for `\g__zrefcheck_id_int` and others.)

`__zrefcheck_zrcheck:nnnnn` An intermediate internal function, which does the actual heavy lifting, and places $\langle\textit{labels}\rangle$ as first argument, so that it can be protected by `\zref@wrapper@babel`. This is more or less what the definition of `\zref` in `zref-user.sty` does for this.

`__zrefcheck_zrcheck:nnnnn {\langle\textit{labels}\rangle} {\langle\textit{*}\rangle} {\langle\textit{options}\rangle} {\langle\textit{checks}\rangle} {\langle\textit{text}\rangle}`

```

362 \cs_new:Npn \__zrefcheck_zrcheck:nnnnn #1#2#3#4#5
363 {
364   \group_begin:

```

Process local options.

```

365     \keys_set:nn { zref-check } {#3}

```

Names of the labels for this zrefcheck call.

```

366     \int_gincr:N \g__zrefcheck_id_int
367     \tl_set:Nx \l__zrefcheck_checkbeg_tl
368       { \__zrefcheck_check_lblfmt:n { \g__zrefcheck_id_int } }
369     \tl_set:Nx \l__zrefcheck_checkend_tl
370       { \__zrefcheck_end_lblfmt:n { \l__zrefcheck_checkbeg_tl } }

```

Set checkbeg label.

```
371 \zref@labelbylist { \l__zrefcheck_checkbeg_tl } { zrefcheck }
```

Typeset $\{\langle text \rangle\}$, with hyperlink when appropriate. Even though the first argument can receive a list of labels, there is no meaningful way to set links to multiple targets. Hence, only the first one is considered for hyperlinking.

```
372 \tl_set:Nn \l__zrefcheck_link_label_tl { \tl_head:n {#1} }
373 \bool_set:Nn \l__zrefcheck_link_star_tl {#2}
374 \zref@ifrefundefined { \l__zrefcheck_link_label_tl }
```

If the reference is undefined, just typeset.

```
375 {#5}
376 {
377   \bool_if:nTF
378   {
379     \l__zrefcheck_use_hyperref_bool &&
380     ! \l__zrefcheck_link_star_tl
381   }
382   {
383     \exp_args:Nx \zrefcheck_get_astl:nnn
384     { \l__zrefcheck_link_label_tl }
385     { anchor } { \l__zrefcheck_link_anchor_tl }
386     \hyperlink { \l__zrefcheck_link_anchor_tl } {#5}
387   }
388   {#5}
389 }
```

Set checkend label.

```
390 \zref@labelbylist { \l__zrefcheck_checkend_tl } { zrefcheck }
```

Check definition. Note that, even if not indicated in zref’s documentation by the usual ‘babel’ markup, \zref@refused is protected by \zref@wrapper@babel.

```
391 \tl_map_function:nN {#1} \zref@refused
```

Run the checks.

```
392 \__zrefcheck_run_checks:nnV {#4} {#1} { \l__zrefcheck_checkbeg_tl }
393 \group_end:
394 }
```

(End definition for __zrefcheck_zrcheck:nnnnn.)

5.2 Targets

```
\zrctarget \zrctarget{\label}{\text}
395 \NewDocumentCommand \zrctarget { m +m }
396 {
397   \refstepcounter { zrefcheck }
398   \zref@wrapper@babel \__zrefcheck_target_label:n {#1}
399   #2
400   \zref@wrapper@babel
401   \zref@labelbylist { \__zrefcheck_end_lblfmt:n {#1} } { zrefcheck }
402 }
```

(End definition for \zrctarget. This function is documented on page ??.)

```

zrcregion      \begin{zrcregion}{\langle label \rangle}
               ...
               \end{zrcregion}

403 \NewDocumentEnvironment {zrcregion} { m }
404 {
405   \refstepcounter { zrefcheck }
406   \zref@wrapper@babel \_zrefcheck_target_label:n {#1}
407 }
408 {
409   \zref@wrapper@babel
410   \zref@labelbylist { \_zrefcheck_end_lblfmt:n {#1} } { zrefcheck }
411 }

```

(End definition for `zrcregion`. This function is documented on page ??.)

6 Checks

What is needed define a `zref-check` check?

First, a conditional function defined with:

```
\prg_new_conditional:Npnn \_zrefcheck_check_<check>:nn #1#2 { F }
```

where $\langle check \rangle$ is the name of the check, the first argument is the $\{\langle label \rangle\}$ and the second the $\{\langle reference \rangle\}$. The existence of the check is verified by the existence of the function with this name-scheme (and signatures). As usual, this function must return either `\prg_return_true:` or `\prg_return_false:.` Of course, you can define other variants if you need them internally, it is just that what the package does expect and verifies is the existence of the `:nnF` variant.

Note that the naming convention of the checks adopts the perspective of the $\langle reference \rangle$. That is, the “before” check should return true if the $\langle label \rangle$ occurs before the “reference”.

The check conditionals are expected to retrieve `zref`’s label information with `\zrefcheck_get_astl:nnn` or `\zrefcheck_get_asint:nnn`. Also, technically speaking, the $\langle reference \rangle$ argument is also a label, actually a pair of them, as set by `\zrcheck`. For the “labels”, any `zref` property in `zref`’s main list is available, the “references” store the properties in the `zrefcheck` list. Besides those, there is also the `lblseq` (fake) property (for either “labels” or “references”), stored in `\g__zrefcheck_auxfile_lblseq_prop`.

Second, the required properties of labels and references must be duly registered for `zref`. This can be done with `\zref@newprop`, `\zref@addprop` and friends, as usual.

6.1 Running

```

\_zrefcheck_run_checks:nnn      \_zrefcheck_run_checks:nnn {\langle checks \rangle} {\langle labels \rangle} {\langle reference \rangle}
\_zrefcheck_run_checks:nnV
412 \cs_new:Npn \_zrefcheck_run_checks:nnn #1#2#3
413 {
414   \group_begin:
415   \tl_map_inline:nn {#2}
416   {
417     \tl_map_inline:nn {#1}
418     { \_zrefcheck_do_check:nnn {####1} {##1} {#3} }
419   }
420   \group_end:

510       \int_compare_p:nNn
511         { \l__zrefcheck_lbl_int } = { \l__zrefcheck_ref_int } &&

```

‘0’ is the default value of `abspage`, but this value should not happen normally for this property, since even the first page, after it gets shipped out, will receive value ‘1’. So, if we do find ‘0’ here, better signal something is wrong. This comment extends to all page number checks.

710           { \l__zrefcheck_lbl_int } = { \l__zrefcheck_ref_int } &&

```

‘0’ is the default value of `abschap` property, and means here no `\chapter` has yet been issued, therefore it cannot be “this chapter”, nor “the next chapter”, nor “the previous chapter”, it is just “no chapter”. Note, however, that a statement about a “future” chapter does not require the “current” one to exist. This comment extends to all chapter checks.

```

‘0’ is the default value of `abssec` property, and means here no `\section` has yet been issued since its counter has been reset, which occurs at the beginning of the document and at every chapter. Hence, as is the case for chapters, ‘0’ is just “not a section”. The same observation about the need of the “current” section to exist to be able to refer to a “future” one also holds. This comment extends to all section checks.
